

String & Characters Practical

Challenge

1. Write a spelling bee method that display a word with missing characters, e.g. A_ple. A player will guess the correct spelling and your program prints a congratulations message if spell correctly.
2. Write a method that counts the number of a char in a given String, E.g. Count the number of char 'a' in String "marvelous", the answer is 1. The character and String should be given from user input.
3. Dupledrome is a word that contains only double letters, like "laammaa" or "ssaabb". I conjecture that there are no dupledromes in common English use. To test that conjecture, I would like a program that reads words from the dictionary one at a time and checks them for dupledromity.

Write a method called isDupledrome that takes a String and returns a boolean indicating whether the word is a dupledrome.

4. Write a method called isPalindrome that takes a String and returns a Boolean if the word is the same when spell backwards. E.g. Mum is an examples of a palindrome,
5. Write a method to check whether the first and the last characters are the same. e.g. the string "e7fdaD" is not the same whereas the string "ex88de" is the same.
6. String tape (String s, int n), is a method to form a String by repeating each character in s n times, e.g. tape("hot",4) should return "hhhhoootttt"
7. String beads (String s, int n), is a method to build a String of n characters by repeating s, e.g. beads ("cool", 10) should return "coolcoolco". You are required to implement this using loop.
- 8.
